Moving Data Around

help rand help help

Data files used in this section: features X.dat (https://raw.githubusercontent.com/tansaku/py-coursera/master/features X.dat), price Y.dat (https://raw.githubusercontent.com/tansaku/py-coursera/master/price Y.dat)

```
%% dimensions
sz = size(A) % 1x2 matrix: [(number of rows) (number of columns)]
size(A,1) % number of rows
size(A,2) % number of cols
length(v) % size of longest dimension

%% loading data
pwd % show current directory (current path)
cd 'C:\Users\ang\Octave files' % change directory
ls % list files in current directory
load q1y.dat % alternatively, load('q1y.dat')
```

```
load q1x.dat
       % list variables in workspace
who
whos % list variables in workspace (detailed view)
               % clear w/ no argt clears all
v = q1x(1:10); % first 10 elements of q1x (counts down the columns)
save hello.mat v; % save variable v into file hello.mat
save hello.txt v -ascii; % save as ascii
% fopen, fread, fprintf, fscanf also work [[not needed in class]]
%% indexing
A(3,2) % indexing is (row,col)
A(2,:) % get the 2nd row.
        \% ":" means every element along that dimension
A(:,2) % get the 2nd col
A([1\ 3],:) % print all the elements of rows 1 and 3
A(:,2) = [10; 11; 12]
                        % change second column
A = [A, [100; 101; 102]]; % append column vec
A(:) % Select all elements as a column vector.
% Putting data together
A = [1 \ 2; \ 3 \ 4; \ 5 \ 6]
B = [11 12; 13 14; 15 16] % same dims as A
C = [A B] or [A,B]- concatenating A and B matrices side by side
C = [A; B] - Concatenating A and B top and bottom
```

Computing on Data

```
%% initialize variables
A = [1 \ 2;3 \ 4;5 \ 6]
B = [11 \ 12;13 \ 14;15 \ 16]
C = [1 \ 1; 2 \ 2]
v = [1;2;3]
%% matrix operations
A * C % matrix multiplication
A .* B % element-wise multiplication
\label{eq:constraints} \mbox{\ensuremath{\%}} \mbox{ A .* C or A * B gives error - wrong dimensions}
^{	t L}\!\!\!\! A .^ 2 % element-wise square of each element in A
1./v % element-wise reciprocal
log(v) % functions like this operate element-wise on vecs or matrices
exp(v)
abs(v)
-v % -1*v
v + ones(length(v), 1)
% v + 1 % same
A' % matrix transpose
%% misc useful functions
% max (or min)
a = [1 15 2 0.5]
val = max(a)
[val,ind] = max(a) % val - maximum element of the vector a and index - index value where maximum occur
val = max(A) % if A is matrix, returns max from each column
% find
a < 3
find(a < 3)
A = magic(3)
[r,c] = find(A>=7) % row, column indices for values matching comparison
```

Plotting Data

```
%% plotting
t = [0:0.01:0.98];
y1 = sin(2*pi*4*t);
plot(t,y1);
y2 = cos(2*pi*4*t);
hold on; % "hold off" to turn off
plot(t,y2,'r');
xlabel('time');
ylabel('value');
legend('sin','cos');
title('my plot');
figure(1); plot(t, y1);
figure(2); plot(t, y2);
figure(2), clf; % can specify the figure number
subplot(1,2,1); % Divide plot into 1x2 grid, access 1st element
plot(t,y1);
subplot(1,2,2); % Divide plot into 1x2 grid, access 2nd element
plot(t,y2);
axis([0.5 1 -1 1]); % change axis scale
%% display a matrix (or image)
imagesc(magic(15)), colorbar, colormap gray;
% comma-chaining function calls.
a=1,b=2,c=3
a=1;b=2;c=3;
```

Control statements: for, while, if statements

```
v = zeros(10,1);
for i=1:10,
    v(i) = 2^i;
end;
% Can also use "break" and "continue" inside for and while loops to control execution.

i = 1;
while i <= 5,
    v(i) = 100;
    i = i+1;</pre>
```

```
i = 1;
while true,
    v(i) = 999;
    i = i+1;
    if i == 6,
        break;
    end;
end

if v(1)==1,
    disp('The value is one!');
elseif v(1)==2,
    disp('The value is two!');
else
    disp('The value is not one or two!');
else
```

Functions

To create a function, type the function code in a text editor (e.g. gedit or notepad), and save the file as "functionName.m"

Example function:

```
function y = squareThisNumber(x)
y = x^2;
```

To call the function in Octave, do either:

1) Navigate to the directory of the functionName.m file and call the function:

```
% Navigate to directory:
cd /path/to/function

% Call the function:
functionName(args)
```

2) Add the directory of the function to the load path and save it:

```
% To add the path for the current session of Octave:
addpath('/path/to/function/')
% To remember the path for future sessions of Octave, after executing addpath above, also do:
savepath
```

Octave's functions can return more than one value unlike most other programming languages . Example:

```
function [y1, y2] = squareandCubeThisNo(x)
y1 = x^2
y2 = x^3
```

Call the above function this way:

```
[a,b] = squareandCubeThisNo(x)
```

Vectorization

Vectorization is the process of taking code that relies on **loops** and converting it into **matrix operations**. It is more efficient, more elegant, and more concise.

As an example, let's compute our prediction from a hypothesis. Theta is the vector of fields for the hypothesis and x is a vector of variables.

With loops:

```
prediction = 0.0;
for j = 1:n+1,
  prediction += theta(j) * x(j);
end;
```

With vectorization:

```
prediction = theta' * x;
```

If you recall the definition multiplying vectors, you'll see that this one operation does the element-wise multiplication and overall sum in a very concise notation.

Working on and Submitting Programming Exercises

- 1. Download and extract the assignment's zip file.
- 2. Edit the proper file 'a.m', where a is the name of the exercise you're working on.
- 3. Run octave and cd to the assignment's extracted directory
- 4. Run the 'submit' function and enter the assignment number, your email, and a password (found on the top of the "Programming Exercises" page on coursera)
